# Process Mining Applied to Complex Medical Claims Management

Presented by Tim King

*Insurance Data Science Conference  
City, University of London  
June 17, 2021*

Insurance

Data

Science

# Business Problem

**“By the time a fraudulent [healthcare] claim has been paid, the probability of recovering the money is approximately 1%”**

Source: *Boston Consulting Group*

(Photo source: iStock)

**“Approximately two-thirds of all claims we define as large losses started out as fairly routine claims, including back, shoulder and knee injuries.”**

Source: *Property Casualty 360*

# Why Process Mining

## Claim Pathways are the New Frontier of Casualty Claims Analysis

**LAGGARD**

*Bill-level  
validation*

\$100

## Two Key Questions

#1

Which claim lifecycles are anomalous?

#2

Which claim lifecycles lead to large \$\$ spend?

# The Approach – R Packages Designed Specifically for This Type of Problem

The logo for bupaR, featuring the word "bupa" in a teal color and "R" in a larger, bold teal font.

“integrated suite of R-packages for the handling and analysis of business process data”

“Toolbox for the manipulation, description and rendering of sequences, and more generally the mining of sequence data”

The logo for TraMineR, featuring the word "TraMineR" in a bold blue font and "Sequence analysis in R" in a smaller blue font below it, all on a light blue background.

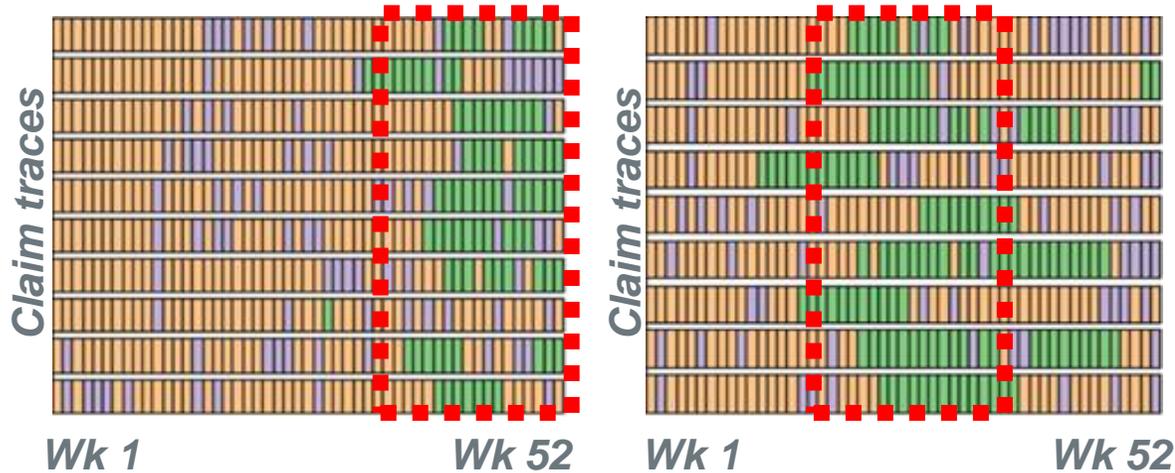

# What we Found – Anomaly Detection

## Unlisted Rehabilitation – *procedure*

CPT Code 97799 – “Unlisted Rehabilitation Service or Procedure”

Cluster 1 (n = 40)

Cluster 2 (n = 9)

Other Procedure

No activity

97799

## “Other” Injury – *diagnosis*

ICD-10 Code T14.90X – “Injury, Unspecified”

Cluster 1 (n = 415)

Cluster 2 (n = 141)

Cluster 3 (n = 181)

Cluster 4 (n = 92)

Cluster 5 (n = 18)

T14.90X

No activity

Different  
Diagnosis

# What we Found – Large Loss Prediction

Diagnosis trajectory matters, illustrating using claims starting with S33.5XX

**#1 Predictor of Large Loss Claims<sup>1</sup>:**  
*Combined Nature and Location of Injury*  
*(e.g. "shoulder bursitis")*

- 2. Age at injury
- 3. Incapacity description from the last known medical certificate
- 4. Specialty of most frequented provider
- 5. Combined nature and location of injury for the claim immediately prior to the current claim
- 6. ....
- 36. Proportion of predominant provider visits count to overall provider visits

Insurer	Cluster Relativities		
	(1) Same Diagnosis	(2) Same Chapter / No Activity	(3) Different Chapter
Travelers	1.00	1.54	2.70
Texas Mutual	1.00	1.61	1.84
Texas Municipal League	1.00	2.09	3.40

- 1. Diagnosis is constant for the first three weeks of the claim
- 2. In weeks two and three, there is either no activity or a different diagnosis that is in the same chapter
- 3. Neither week two nor week three has the initial chapter

# Conclusions and Next Steps

- **Scale limitations**
  - If overcome, can model on more data
  - Opportunities to do in-database, especially distance calculation
- **Opportunities to improve the ‘math’**
  - Alternative distance methods and / or cost functions
  - Improved intelligence for selecting cluster count
- **Additional use cases – e.g., actuarial**
  - Reserving and finance
  - Pricing & underwriting
